

What women are saying

“ I’m a regular runner and didn’t want implants that weigh me down and bounce excessively.

“ Why carry extra weight when you don’t need to?

“ My B-Lites feel so natural, its like they were always a part of me.

The professional opinion

“ The weight of the implant may influence the age-related changes that normally take place in breasts.

“ B-Lite was associated with shorter recovery and return to work times, alongside reduced pain levels when compared to implantation of traditional silicone breast implants.

Dr Kai Uwe Schlaudraff, Plastic Surgeon, Geneva

(Presented at American Society for Aesthetic Plastic Surgery annual meeting 2016)

LIGHTWEIGHT BREAST IMPLANTS

Lightweight breast implants

Surgeon & implants – the key to achieving a beautiful shape, natural feel and lasting results.

The skills of the surgeon combine with the quality of the implants to achieve the desired results.

Over the last fifty years, surgical skills have come a long way but breast implants have hardly changed, until now.

B-Lite breast implants are the only lightweight option for augmentation and reconstruction.

up to
30% lighter

Why choose B-Lite®?

The tissues supporting the breast naturally lose their elasticity over time, making them increasingly susceptible to the relentless force of gravity. More weight results in more stretch.

Force exerted on breast tissue is in direct proportion to weight = Hooke's Law

Breast tissue is similar to a rubber-band – when stretched too much, it doesn't return to its original shape.

Reducing the weight of the breast implant reduces the pull of gravity on the breast.

The technology

B-Lite lightweight breast implants combine well known and clinically proven materials in an innovative way to provide natural fullness, feel and strength with minimal weight.

Hollow microspheres are permanently bonded within the silicone gel

Microspheres are the magic ingredient. By permanently bonding tiny hollow spheres in the medical grade silicone gel we can make implants up to 30% lighter than the equivalent all-silicone implants.

The microspheres are very strong – they easily withstand pressures experienced during flights and diving.
